Titus Illuminate.
Identify and protect data at rest

titus
by HelpSystems

The speed of data creation continues to increase, and that means the volume of data at rest is growing exponentially. With more people accessing and storing files in a multitude of network and cloud repositories, your sensitive data could be just about anywhere.

Titus Illuminate helps you discover and identify your data at rest so you can apply classifications, including persistent metadata to secure your most valuable data.

How Illuminate works

Illuminate scans file storage, including on-premise file shares, Box, Dropbox, OneDrive, and Microsoft SharePoint and SharePoint Online. It examines and automatically classifies the files it discovers, ensuring appropriate data protection is applied. And, as it scans files, Illuminate gathers extensive information about each file, building a data inventory for you to run analytics to identify risk areas.

Enhance your security ecosystem with data identification and classification

Titus metadata can be leveraged by other security solutions, such as data loss prevention (DLP), enterprise rights management (ERM), cloud access security brokers (CASB), and next generation firewalls to enforce the data protection policies you've defined.
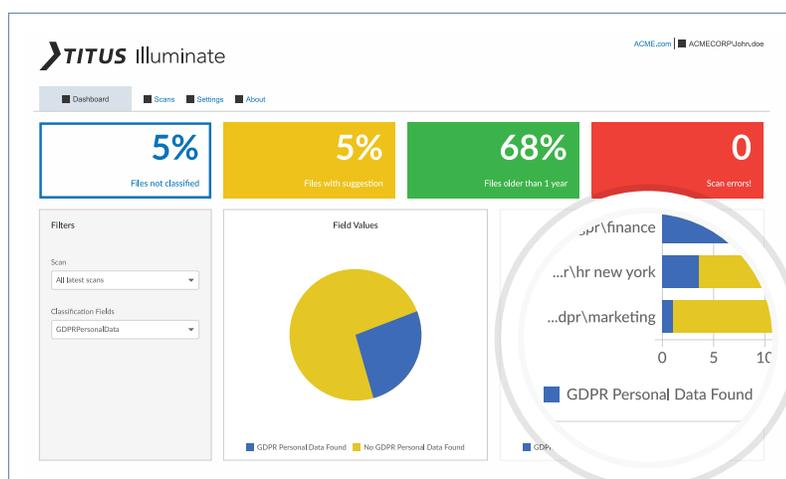

Comply with data protection regulations and gain insight into data at risk.

HIGHLIGHTS

Titus Illuminate helps you define what and where your data is, who has access to it, and how to protect it.

- Leverage the Titus Intelligent Policy Manager to detect and understand your data at rest

- Protect files with encryption and remediation options

- Analyze results to better understand your data

- Enhance the ability of DLP, ERM, and other security solutions to apply the appropriate controls based on classification

- Smart REGEX delivers a faster and more accurate detection of regular expressions

- Train a model and deploy Automated Categorization powered by Machine Learning to identify and protect company-unique data like intellectual property and trade secrets

- Supports the out-of-the-box libraries and deep learning capabilities of Titus Accelerator for Privacy to identify and protect data in compliance with global privacy regulations

Titus Illuminate. **Identify and protect data at rest**

Identify and protect
data at rest

By identifying and classifying data at rest, organizations can engage the entire ecosystem of information security products. They can also engage end users by building awareness of safe information handling, information sensitivity, and security policy. Illuminate enhances the ability of DLP, ERM and other security solutions to apply the proper security controls based on the classification. And it can apply additional layers of security, such as automatic encryption, to your most valuable data.

Comply with
regulations

The increasing number of data protection and cybersecurity regulations across industries and geographies have made the identification and security of data at rest a growing concern. Illuminate can apply and detect metadata on data at rest, allowing enterprises to prove regulatory compliance. When used with third-party encryption and DRM software, enterprises can demonstrate use of best-of-breed technology and best practices with regards to regulations such as GDPR and the protection of personal data.
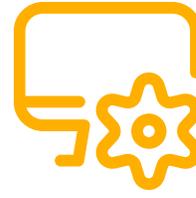

Improve
organizational efficiency

Illuminate can automatically embed or read Titus Classification metadata based on your policies, saving time and resources in identifying and protecting data at rest. Scanning optimization allows organizations to prioritize which files to process, ensuring that high-value assets are classified and protected first while allowing full visibility into the complete inventory of data at rest. Organizations can identify and remediate risk exposure by managing and reporting on access to sensitive data and by disposing of redundant or obsolete data.
