

Hillstone iSource

Extended Detection and Response (XDR) Solution

Hillstone iSource is a data-driven, AI-powered extended detection and response (XDR) platform that integrates massive security data, investigates correlations of incidents, identifies potential threats, automates security orchestration and responds cohesively across multiple security products and platforms. It brings a radical new approach to cybersecurity with complete visibility, highly accurate threats identification and swift containment and mitigation for unrivaled security operation efficiency.

Product Highlights

Unified Data Collection from Multiple security Products with Full Visibility

Hillstone iSource collects various types of data, such as threat logs and incident reports, from almost any source across Hillstone's product stack and as well as 3rd party products. By standardizing and integrating heterogeneous data across components, including cloud, network and endpoints, iSource breaks down security information silos. It not only brings full security visibility with far fewer blind spots, but also improves detection accuracy and provides effective and efficient defense against threats.

Advanced ML-driven Analytics and Detection

By synergizing the data and logs collected across the entire security fabric, as well as threat intelligence from top threat intelligence sources, Hillstone iSource can discover even stealthy and evasive threats, and attribute the attacks. Powered by machine learning technology and statistical algorithms, its behavior analytics engine helps distinguish anomalous activities among a large amount of integrated data. Its correlation analysis engine consolidates individual incidents for context awareness, and applies analysis to correlated data to identify high-fidelity incidents, provide a

complete picture of an attack chain and further help in the investigation of the attack's purpose. Its powerful log analysis has built in threshold- and status-based detection and correlation analysis capability that allows security analysts to define customizable rules to identify key threats via artifacts. The Search Processing Language (SPL)-based log search engine also alleviates the pain of searching and analyzing massive logs.

Comprehensive Vulnerability and Risk Management

Hillstone vulnerability management helps identify and present vulnerabilities by leveraging the industry's leading vulnerability assessment solution. It also supports adding new scanners for customization or even manually importing a vulnerability report file for further containment of threats. Assets are the core for risk management. Hillstone iSource provides comprehensive risk management to assets like servers, endpoints, or even applications and services, from multiple dimensions including risks, vulnerabilities and threat events. It presents statistical data, such as distribution and trends of threats and vulnerabilities, along with detailed information of individual assets. This holistic approach protects assets by identifying and mitigating potential exposures to threats.

Automated Security Orchestration and Cohesive Response

Hillstone iSource offers automated security orchestration and response capability with built-in playbooks, integrated

interactions with Hillstone security products and the ability to assign tasks for collaborative case management. Besides predefined playbooks that offer optimized workflows and responses, Hillstone iSource also offers the agility and flexibility to define automated workflows visually in playbooks based upon ingested incidents or alerts, intelligence queries and actions of response. These playbook-driven responses combine automated tasks that can span multiple Hillstone devices, such as Hillstone NGFW, NIPS, CloudEdge, CloudHive, etc., with manual tasks handled respectively through incident case management. Certain 3rd-party devices can also be supported in playbooks via RESTful APIs or SSH connection. This enables swift incident triage and attack containment before damage can be done.

Unified Management and Reporting with Intuitive and Customizable Console

The customizable dashboard allows simple and rapid access to the organization's security posture with comprehensive statistical information such as rankings and counters, as well as incident summarization and security trends with graphical charts and lists. The intuitive design provides an optimized user experience for management and operations. Hillstone iSource also supports template-based or customizable reports that can be generated on schedule or on demand. Public APIs enable integration with third-party tools or security products to inject security data generated across the entire security fabric and perform interactions to contain threats.

Features

Data Collection

- Support collection of data includes netflow, metadata, Syslog, Sysmon, Linux Syslog from Hillstone's security devices
- Support data collection of RADIUS message
- Support third-party device integration for data collection

Full Visibility

- Support threat hunting
- Support threat events monitoring, and visualization of risky assets and risk trends
- Support distributed display of threat geographic connections
- Support full-screen display of statistical and detail information of overall security, servers' security, endpoints security, vulnerabilities, areas security, threat events, and hierarchical management
- Support establishing the insight topology of network flow by collecting and analyzing the traffic
- Key threat events overview
- Support listing threat events of individual BDS

Detection Rules

- Support rule configuration of threat detection for scanning, file, HTTP detection, suspicious protocol, brute force, DNS, blackmail, mining, USB behavior, violating access, weak password, and user-defined threats

Threat Analysis

- Rule based threat detection
- Threat log analysis
- Behavior analysis
- Correlation Analysis
- Statistics and analysis of risky servers, risky terminals, and threat events
- Support the evidence collection, processing and status marking of threat events
- Threat evidence information supports multiple decoding types, such as URL, Base64, Unicode, UTF-8, HEX, etc.
- Support MITRE ATT&CK Matrix mapping
- Support threat aggregation and reconstruction of attack chain

Assets Management

- Support management of server assets, terminal assets and unclassified assets
- Support assets overview
- Support favorite assets management
- Support asset classification

- Support asset fingerprint extraction
- Support grouping management of servers, terminals and different types of server business
- Support automatic discovery of assets, including active scanning and manual importing of assets
- Support asset inventory management
- Support asset source priority configuration
- Support display of users' status
- Support centralized management of assets to be imported and assets to be updated
- Support extracting asset fingerprints from vulnerability reports

Vulnerability Management

- Support statistical and detail information of vulnerabilities
- Support import of third-party vulnerability reports
- Support vulnerability scanning with built-in and third-party scanners
- Support management of scanning tasks

Information Management

- CVE hotspot threat information notification
- Support intelligence database of DNS domains, malicious codes, IP, vulnerabilities, intrusion detections, geo-location, URL and MITRE & ATT&CK® knowledge base
- Support intrusion detection and web attack detection signature database
- Support abnormal behavior and malware behavior model database, and honeypot knowledge base
- Comprehensive intelligence with other relevant threats
- Support offline and online upgrade of the intelligence database by manually and periodically
- Support whitelist of global, DNS, and file
- Support blacklist of DNS, malicious code, and IP

Event Correlation Analysis

- Support correlation analysis of massive data and detection of kill chain
- Support centralized and classified search of global threat events
- Support searching by key words, SPL, and pre-defined conditions

Incident Response

- Support case management system
- Case status update and review
- Interactive devices/ services (security devices / threat intelligence service)
- Support third-party device integration over RESTful APIs or SSH

- Playbook-based auto or semi-auto(with double confirmation) orchestration and response, with support of pre-defined playbooks and validity period setting
- Support email notification to administrators for secondary confirmation of firewall policy deployment
- Support policy aggregation
- Support marking event status within the playbook
- Support manually reissuing unsuccessful playbook-driven automated response

Alerts

- Support alarms based on threshold rules and traffic pulse rules
- Real-time display of threat events
- Support alert notification of SMS, email and WebUI

Reporting

- Support four report templates including overall security risk, endpoints security risk, server security risk, and incident response report
- Support optional function of report task
- Support periodic or on-demand report
- Support online preview
- Support export report in PDF/WORD format
- Support custom logo
- Support email notification of report generation
- Support management of classified protection

System Configuration

- Support management of user authority, Syslog, Netflow, logs storage, evidence information, network configuration, mail configuration, and license configuration
- Support assigning user roles with access privileges(administrator, operator and auditor)
- Support trusted host configuration
- Support integration with HSM
- Record of system logs
- Sync-up with BDS rules
- Support HA and clustering up to 5 nodes
- Support hierarchical management
- Support system logo and title customization

Supported Platforms

- Linux: CentOS 7
- Windows: Microsoft Windows 10
- VMware: VMware EXSi 6.7

Specifications

Models		SG-6000-ISC6205	SG-6000-ISC6210	SG-6000-ISC6220
Performance	Throughput	3Gbps	6Gbps	15Gbps
	Event Processing	5000EPS	8000EPS	15000EPS
